New strain of swine flu in Ukraine, Swine flu h1n1 might have mutated, pneumonic plague

Friday, November 6, 2009 - 13:35

The first deputy minister of Health in Ukraine said in a statement that they have a different h1n1 swine flu than the rest of the world and US. In 6 days 500 000 people have been infected, 93 confirmed deaths. Statements from a lot of departments and officials seem to disagree but the fact is that if this is the h1n1 it might of either mutated or this is another swine flu strain.

The reason for this is obviously as stated above and that the strain in the Ukraine has a much bigger rate of filling the lungs with blood. This can be blamed on lack of public health but according to sources this is not the case.

The plague or virus in the Ukraine has 10 times the mortality rate than the normal swine flu.

In a paper published in microbiology news called resurecting influenza pandemic strains. The author regonized 5 strains of weaponized flu.

Confirmation that this is a mutated version: (or not a mutation of h1n1 but a viral pneumonia which is something different)

1. 250 000 to 500 000 infected in one day, way faster than any other country the h1n1 has been
2. Many cases of viral pneumonia where the lungs fill with blood, a much higher viral pneumonia rate than any other country
3. Ukraine Health minister said himself that "swine flu has mutated"
4. Much bigger death rate than normal

The most cases are in the rural north west area of the Ukraine. That statistics are not unusual for a few months but this is for a few days.

On the ground though, unconfirmed reports say that people are going on as normal, they also say that this is fear mongering. (speaking to locals)

WHO needs to confirm that the genes have are different, if they are not that means the swine flu has not mutated.

Everyone is waiting for the gene sequences which will confirm whether this has been hyped up, a real mutated h1n1 or just bad health services in the Ukraine.

UPDATES TO FOLLOW

Update 1.

Please note. The h1n1 and the viral pneumonic plague is two different things. What we are saying is that either the h1n1 has mutated OR there is a viral pneumonic outbreak at the same scale of the h1n1.

There are now as of time of writing 871,037 Influenza/ARI Cases over the Ukraine, 39,603 has been hospitalized and 135 people have died. We cant say home many of those people are affected with wich, either h1n1 or the pneumonic plague or something else because it still remains unclear.

Ukraine remains in a state of Emergency.
